

Feed Antioxidants

Feed additives, such as **antioxidants**, are products used in animal nutrition to achieve an effect on the feed itself, on the animals, on food products obtained from the animals consuming the feed additive or on the environment.

Oxiris uses only additives authorized by European Legislation.

“Feed additives may not be put on the market unless they have been authorised following a scientific evaluation carried out by EFSA demonstrating that the additive has no harmful effects on human and animal health and on the environment.

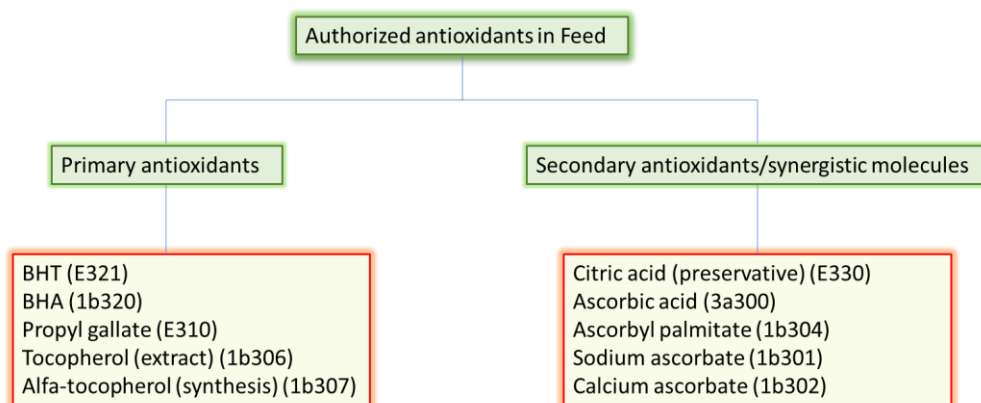

They are authorised for 10 years. Subsequently, applicants must submit a new request showing that the additive remains safe under the conditions of the authorisation.”

Classification of feed additives (EFSA)

- **Technological** additives: preservatives, **antioxidants**, emulsifiers, acidity regulators, silage additives.
- **Sensory** additives: flavours, colourants.
- **Nutritional** additives: vitamins, amino acids, trace elements.
- **Zootechnical** additives: digestibility enhancers.
- **Coccidiostats** and **histomonostats**.

List of antioxidants authorized by European Union as feed additives

Regulation (EC) No 1831/2003. European Union Register of Feed Additives.
Edition 05/2021 (293). Annex I – 19.08.2021
